Right-Censored Observations

Joint probability of observing data v:

$$f(\boldsymbol{v} \mid \boldsymbol{\eta}) = \prod_{i=1}^{r} f(t_i, \boldsymbol{\eta}) \prod_{i=r+1}^{n} S(c_i, \boldsymbol{\eta})$$

Bayesian Item Response Modeling

(日) (同) (三) (三) (三)

Problems in Survival Modeling

• Censoring: data missingness, subject does not undergo the event

Bayesian Item Response Modeling

(日) (同) (三) (三) (三)

Problems in Survival Modeling

- Censoring: data missingness, subject does not undergo the event
- Unobserved between-individual variation in the probability to experience the event

- 4 日 ト - 4 日 ト - 4

Problems in Survival Modeling

- Censoring: data missingness, subject does not undergo the event
- Unobserved between-individual variation in the probability to experience the event
- Presence of time-varying covariates (e.g., prognostic factors)

• Prognosis, course, outcome of a disease

Bayesian Item Response Modeling

(日) (同) (三) (三) (三)

- Prognosis, course, outcome of a disease
- Model probability of surviving given (possible) prognostic factors (risk factors, individual characteristics)

・ 同 ト ・ ヨ ト ・ ヨ

- Prognosis, course, outcome of a disease
- Model probability of surviving given (possible) prognostic factors (risk factors, individual characteristics)
- Popular model: Cox Proportional Hazards Model:

$$\frac{h(t \mid \boldsymbol{x}_1)}{h(t \mid \boldsymbol{x}_2)} = \text{constant}$$

$$\begin{aligned} h(t \mid \boldsymbol{x}) &= h_0(t)g(\boldsymbol{x}) \\ &= h_0(t)\exp(\boldsymbol{\eta}^t \boldsymbol{x}) \end{aligned}$$

- Prognosis, course, outcome of a disease
- Model probability of surviving given (possible) prognostic factors (risk factors, individual characteristics)
- Popular model: Cox Proportional Hazards Model:

$$\frac{h(t \mid \boldsymbol{x}_1)}{h(t \mid \boldsymbol{x}_2)} = \text{constant}$$

$$h(t \mid \boldsymbol{x}) = h_0(t)g(\boldsymbol{x})$$

= $h_0(t)\exp(\boldsymbol{\eta}^t \boldsymbol{x})$

• Violate proportional hazards assumption when using time-varying covariates

Discussion

Bayesian Item Response Modeling

A (1) < A (1) < A (1) </p>

Joint Modeling Approach

• Patients and controls with different (latent, time-continuous) backgrounds may have different survival prognosis

Bayesian Item Response Modeling

<ロト < 同ト < 回ト < 回

Joint Modeling Approach

- Patients and controls with different (latent, time-continuous) backgrounds may have different survival prognosis
- Longitudinal factor/covariates are measured infrequently and with measurement error

Joint Modeling Approach

- Patients and controls with different (latent, time-continuous) backgrounds may have different survival prognosis
- Longitudinal factor/covariates are measured infrequently and with measurement error
- Subjects enter the study at different time-points, measured at different times, different number of measurements

Joint Modeling: Two-stage procedure

• Survival information not used in modeling the covariate process.

Bayesian Item Response Modeling

(1)

Joint Modeling: Two-stage procedure

- Survival information not used in modeling the covariate process.
- New growth curves are estimated at each new event (interpretability)

< ロト < 同ト < ヨト < ヨ

Joint Modeling: Two-stage procedure

- Survival information not used in modeling the covariate process.
- New growth curves are estimated at each new event (interpretability)
- Handle measurement error in time-dependent (latent) covariate(s) survival model

Joint Modeling

• Joint distribution (survival data, response data):

$$p(\mathbf{t}, \mathbf{y} \mid \mathbf{x}) = \int p(\mathbf{t}, \mathbf{y} \mid \mathbf{\eta}, \mathbf{x}) p(\mathbf{\eta} \mid \mathbf{x}) d\mathbf{\eta}$$

=
$$\int \int p(\mathbf{t} \mid \mathbf{\eta}, \mathbf{x}) p(\mathbf{y} \mid \mathbf{\eta}) p(\mathbf{\eta} \mid \mathbf{\Omega}, \mathbf{x}) p(\mathbf{\Omega}) d\mathbf{\eta} d\mathbf{\Omega}$$

=
$$\int \int p(\mathbf{t} \mid \mathbf{\eta}, \mathbf{\Omega}, \mathbf{x}) p(\mathbf{y} \mid \mathbf{\eta}) p(\mathbf{\eta} \mid \mathbf{\Omega}, \mathbf{x}) p(\mathbf{\Omega}) d\mathbf{\eta} d\mathbf{\Omega}$$

• Define $v_i = \min(t_i, c_i)$,

$$D_i = \begin{cases} 1 & \text{Event observed} \\ 0 & \text{Censored observation} \end{cases}$$

Bayesian Item Response Modeling
